**Dissertation protocol:**

**INTRODUCTION:**

Adequate and appropriate nutrition during 1000day window period (the period between a women's pregnancy and her child's second birth day) is extremely crucial for the child 's brain development, healthy growth and a strong immune system. Malnutrition in this window period can transcend generations and affects the entire life style of an individual ie ., malnourished women give birth to malnourished daughters who grow up and become malnourished mothers themselves . The right nutrition during this period helps to develop child's brain and reduce risk of developing chronic diseases.

**Moderate Acute Malnutrition:**

A Child who has weight for height SD score between -3SD to -2SD or mid upper arm circumference of 11.5-12.4cm and has no bilateral fitting oedema.

**Severe Acute Malnutrition;**

It is defined by presence of very low weight for height/length (SD score below-3SDof the median for WHO child Growth Standards),and/or mid upper arm circumference <11.5cm, and/or by the presence of bilateral pitting oedema.

Severe acute malnutrition is a life threatening situation. A child with SAM must be managed differently as compared to other sick children not having SAM because physiology of child with SAM is seriously abnormal due to reductive adaptation. The systems of the body beginto slow down with severe acute malnutrition. The systems slow done and do less work in order to allow survival on limited calories , called reductive adaptation. Children of SAM are at increased risk of death from :

- Hypoglycaemia, as there is a problem of glucose supply from liver and muscles while at the same time, demand for glucose is high to fight infections.
- Hypothermia, as less heat is generated due to reduced BMR.

among the protista rather than from primitive plant.

The Romans associated the lesions with insect and named the disease TINEA meaning any small insect larva (clothes moth). They wrongly used the term that insect were the cause of such infections Dermatophytes are closely related keratinophilic fungi causing dermatophytosis (ringworm or tinea) by virtue in part of their ability to degrade keratin and thus invade the skin, hair and nails.

Females are more susceptible to develop tinea pedis, tinea manuum and onycholysis due to household work.

Pregnant women are more susceptible to develop Dermatophytic infection because of decreased cell mediated immunity

**INTRODUCTION TO THE STUDY**

DERMATOPHYTOSIS refers to the superficial fungal infection caused by either of the three groups of keratinophilic fungi namely

- TRICHOPHYTON ( infects skin ,nails , hair) ,
- MICROSPORUM (infects skin ,hair) ,
- EPIDERMOPHYTON (infects skin ,nails)

Dermatophytic infection are the most common cause of the superficial fungal infection

- These are present as chronic , recurrent ,treatment unresponsive

\_ Dermatophytes causes significant cutaneous morbidity .Itching is intense and severe , social embarrassment and impair quality of life .

- Dermatophytes are main
